Giant coronary sinus of Valsalva aneurysm

A 29-year-old female was admitted to our hospital with nonspecific chest pain and dyspnea. Physical examination revealed systolic murmur. Laboratory findings were unremarkable. Transthoracic echocardiography revealed a cystic mass adjacent to the right atrium and ascending aorta that was believed to be a large aneurysm of right coronary artery (RCA). Coronary computed tomography angiography (CTA) showed a relatively thin neck, bilobed, and giant aneurysm originating from the anterior right side of sinus of Valsalva, which measured $9 \times 5$ cm in diameter. There was eccentric calcification on the aneurysm wall. The aneurysm impressed the right ventricle and atrium and minimally displaced RCA (Fig. 1). These findings were confirmed with the catheter angiography (Fig. 2).

Sinus of Valsalva Aneurysm (SVA) is a rare entity that is most frequently observed in the right sinus. Associated cardiac anomalies are observed in most cases such as ventricular septal defect. It is usually asymptomatic if unruptured. In cases with ruptured SVA, fatal complications can be observed. Endovascular or open surgery is the choice of treatment.

AA - ascending aorta; LA - left atrium; LV - left ventricle; PA - pulmonary artery; RAA - right atrial appendage
Rapidly growing fungus ball on prosthetic valve: Candida albicans endocarditis

A 58-year-old woman presented with recent history of fever. She had history of prosthetic aortic and mitral valve implanted four years ago. Blood cultures were negative and transesophageal echocardiography (TEE) detected a large mass within the mitral prosthesis (Fig. 1a, Video 1). After seven days under antibiotherapy, repeated TEE revealed rapidly growing giant vegetation within the valve leaflets (Fig. 1b-d, Video 2, 3). Surgery was performed and resection material showed fungus ball (Fig. 2a). Cultures and histopathological examinations (Fig. 2b, 3a, b) were positive for Candida albicans.

Candida albicans is one of the most important fungal pathogens, caused prosthetic valve endocarditis in our case, with predisposing factors such as major operations, prosthetic material, total parenteral nutrition, broad-spectrum antibiotics, diabetes mellitus, and immunosuppression. Our patient had parenteral nutrition and broad-spectrum antibiotics. A combination of surgical resection and antifungal drug therapy is the Gold standard for treatment.
